SEFI Aging Operators

Jason Dutton

Overview

Aging operators in SEFI quantify manifold fatigue and potential life-extension through curvature and resonance control.

Fatigue Operator

$$\hat{F} = \partial_t \Phi + \delta \, \nabla^2 \Phi$$

Life-Extension Operator

$$\hat{L} = -\hat{F} + \epsilon \, \partial_t^2 \Psi$$

Interpretation

Aging is associated with increasing fatigue; life-extension corresponds to reducing effective fatigue via resonance-driven restoration.
