SEFI Metric Master Equation

Jason Dutton

Overview

The SEFI metric describes curvature arising from single-electron waveform geometry. It contains both static and dynamic curvature components.

SEFI Metric Definition

$$g_{\mu\nu} = \eta_{\mu\nu} + \Phi_{\mu\nu}(x) + \Psi_{\mu\nu}(x,t)$$

Where:

- $\Phi_{\mu\nu}$ = static curvature from electron geometry
- $\Psi_{\mu\nu}$ = dynamic resonance curvature

Governing Equations

Static curvature field:

$$\Box\Phi_{\mu\nu} - \partial_\mu\partial_\nu\Phi = \rho_e\,\omega_c$$

Dynamic resonance curvature:

$$\Box\Psi_{\mu\nu} + k^2\Psi_{\mu\nu} = \rho_e\,\omega(t)$$

Interpretation

The SEFI metric unifies electron curvature, resonance geometry, and dynamic waveform behavior into a single geometric framework.
