Warp-Metric Field Equations

Jason Dutton

Overview

Warp curvature arises from electron-induced metric tension in the SEFI framework. The metric responds to both electron sources and warp-specific stress-energy.

Field Equation

$$R_{\mu\nu} - \frac{1}{2} g_{\mu\nu} R = T^{(e)}_{\mu\nu} + T^{(\text{warp})}_{\mu\nu}$$

Warp Stress-Energy

$$T^{(\text{warp})}_{\mu\nu} = \alpha \, \partial_\mu \Phi \, \partial_\nu \Phi$$

Electron Curvature Source

$$T^{(e)}_{\mu\nu} = \beta \, \omega_c^2 \, u_\mu u_\nu$$

Interpretation

Warp-metric behavior is driven by electron curvature and additional warp tension, capturing non-classical geometric responses in SEFI.
